

Are there

germs

in your office?

A typical desk can support more than 10 million bacteria – 400 times more than a loo seat!

Bacteria can include coliform – normally found in human waste!

Hundreds of thousands of bacteria are found in hot spots – printer button, coffee machine button, lift button.

Telephones are the worst with around 25,127 germs per sq inch, desktops 20,961, Keyboards 3,295 and Loo seats only 49!

Office workers instructed to clean their workspace daily with disinfecting wipes reduced bacterial levels by 99%.

Does this make you want to take action?
