

Airlight^{PLUS}

for racehorses with **MORE** air on the home straights

How is AIRLIGHT Plus working?

Ingredients of Airlight Plus are incorporated into the cells of the smallest part of the lungs called alveoli and stabilize them in order to prevent the burst of the cells during the highest blood-gas exchange in the race with the consequence of lung bleeding.

How long should AIRLIGHT Plus be given?

Airlight Plus should be given 100g each over 10 days to get the highest effect. AIRLIGHT Plus is not a drug, which works immediately, instead of Airlight Plus does not have any known side effects and is free of doping. Airlight Plus is a natural complementary feed, which needs roughly 3 days to be effective as the ingredients have to be metabolized and placed into the alveoli of the lungs.

How long is AIRLIGHT Plus effective?

Just as the ingredients need time to reach the site of action in the lungs they also need time to disappear. That means after stopping feeding Airlight Plus the ingredients remain effective some days longer. But after 5 days the old situation before feeding comes back again.

What will happen, if I stop using AIRLIGHT Plus after 3 weeks?

Look also at the answer before. Again in the first days nothing will happen, as the cells in the alveoli are not rebuilt every day. After three days more or less the former condition comes back. Whether lung bleeding reoccurs or the lungs are more resistant now against oxidative stress at the blood-gas barrier, this depends on the individual situation of the horse.

Is there a risk for overdosage of AIRLIGHT Plus?

If you follow the feeding advice of 100g per day only, there is no risk. Higher dosages should only be given after the vet's advice. In general we are talking about nutrients and they are mostly safe against overdosages.

What is the competitive edge of AIRLIGHT Plus ?

Airlight Plus is a totally different and innovative* product concept, as the ingredients are not designed for nutritional use but are beneficial in their functional use like the incorporation into cell membranes. In a publication McMahon et al. described that the sensitive blood-gas barrier in the lungs is under nutrient control.

* Patent pending

Additionally AIRLIGHT Plus has an intelligent blend of different vital substances to protect the cells from oxidative stress, which develops during gas exchange especially on the home straights.
